

Sometimes you just want full service

If your security team is small or you don't have the time to manage patching and equipment, SIEMonster offers a full-service solution in the cloud.

Using the SIEMonster portal, you can log on and see all your security events and alerts 24/7 without the hassle of setting up any infrastructure, backups, or patching. SIEMonster offers both our Professional and Enterprise edition as a SaaS in the cloud.

SIEMonster provides a virtual machine or service appliance to install into your network. All your security logs are encrypted stored and forwarded into your SIEM as a service instance in Amazon AWS. The onsite device ensures you will never lose any security data if there are any network outages.

Siems that don't provide this, risk log continuity in the event of communication failure. We don't want you to lose data logs if your connection is down.

SIEMonster is a collection of the best open-source security tools, as well as our own, to provide a SIEM for everyone.

We showcase the latest and greatest tools for security professionals.

We have customers all around the world now using our product that was once using Gartner quadrant competitors.

Don't believe us? Ask for one of our case studies.
